

Reconciliation Agent

S. Abhijit Rao | FDE Quest Submission | 13th May 2026

What I Built : Reconciliation Agent is a AI-native bank reconciliation agent for small businesses. Given a folder of customer invoices, vendor bills, and a bank statement (all PDFs), it automatically matches every bank line to the document that explains it and produces a structured Excel audit report.

Why This Problem : Bank reconciliation has a ground truth. Either a match is correct or it isn't — you can verify every number manually. For an AI agent evaluation context, that verifiability is what makes the problem honest. It also has universal reach: every business with a bank account does this monthly, the workflow is identical across industries, and the cost (5–10 hours/month) is a number the user already knows.

Performance Score: 7916/ 10,000 (79.16%)

Comparison to default Cursor + Claude :

Running the same task through default Cursor without the agent gave me a readable text summary. The big numbers were broadly right. But there was unstructured Excel output, no traceability between sheets, nothing a finance team could actually act on. ReconAgent's structured output, reason-coded unmatched items, and finance-facing Summary Dashboard are meaningfully.

What will I fix next : The cross-sheet propagation issue is the priority — partial payments and near matches need to update the Invoice and Bills sheets, not just the Bank sheet. After that: a dedicated Unmatched Items sheet (currently you have to filter), the status field logic for confirmed payments, and page-level citations on matched rows for proper audit traceability.

Honest verdict : The detection layer works. The propagation layer has a bug. The output is usable today for a small business doing month-end close; it's not quite ready for a formal audit without those fixes. 79% is an accurate number.

Flow Chart :
